

Sales Orders Analytics Dashboard

Build & verification report

Project: Sales Operation | Source: sales_orders_23-26.xlsx | Data as of 17 Aug 2026 | Report generated 3 Sep 2026

Live dashboard: [Open Sales Orders Analytics](#) (private to the workspace owner; also a chip in the project's Pages tab)

1. Dataset overview

Every sheet and column of the source workbook was ingested and profiled before any chart was designed. The inventory below is what the dashboard was built from — the full measurable surface of the data, not a pre-selected subset.

Grain, volume and coverage

Property	Value
Row grain	One row = one sales order (500 unique order ids, no duplicates)
Row count	500 orders
Date range	20 Jan 2023 – 17 Aug 2026 (44 months)
Completeness	16 columns, no null values in any column
Time grains supported	Daily, weekly, monthly, quarterly, yearly (44 months is ample for monthly and quarterly views)

Column inventory by type

Column type	Columns
Identifier (1)	Order id — unique per row
Date + calendar keys (4)	Order date, plus derived year, quarter and month (YYYY-MM) keys
Grouping dimensions (6)	Region, state, customer, customer segment, category, product
Numeric measures (5)	Quantity, unit price, revenue, cost, profit
Status flag (1)	Order status — Completed, Pending, Processing, Cancelled

Reconciled totals

Revenue was verified to equal quantity × unit price on every row, and profit to equal revenue – cost on every row. Totals were checked against the workbook before loading and re-checked after loading into the project database:

Measure	Reconciled total
Total revenue	\$1,594,785
Total profit	\$861,256

Profit margin	54.0%
Total units	2,277
Orders	500

Derived KPI surface

The five numeric measures plus the order count yield the following computable KPIs, all of which are used somewhere in the dashboard:

- **Sums** — revenue, profit, cost, units, order count
- **Averages** — average order value, average profit per order, average unit price, average units per order
- **Ratios and rates** — profit margin (profit ÷ revenue), cost ratio (cost ÷ revenue), markup, completion rate, cancellation rate, revenue concentration in top accounts
- **Period comparisons** — trailing 12 months vs the preceding 12 months on every sum and average, plus year-over-year and quarter-over-quarter growth

Filterable dimensions

Nine dimensions group or classify the records and are therefore all exposed as filters: year (4 values), quarter (4), region (4), customer segment (3), category (4), order status (4), state (10), product (12) and customer (18).

2. Dashboard structure — seven tabs, 53 visuals

The inventory was grouped into seven purpose-based tabs by analytical theme, each kept within a readable 5–9 visuals. Chart footprints are sized by content density: dense ranked lists and 44-month trends take full-width rows at 300–360px tall, while short-category charts share rows three or four across.

Dashboard

Executive overview — the headline numbers plus the six views that explain them.

Headline KPI band

- **Revenue** — \$1,594,785, +20.3% vs prior 12 mo
- **Profit** — \$861,256, +30.3% vs prior 12 mo
- **Profit margin** — 54.0%, +4.3pp vs prior 12 mo
- **Orders** — 500, +6.0% vs prior 12 mo
- **Average order value** — +13.6% vs prior 12 mo
- **Units** — 2,277, +10.0% vs prior 12 mo

Charts

- How have revenue and profit moved month by month? (line)
- Which customers generate the most revenue — top 10? (ranked bar)
- Which categories drive revenue? (bar)
- How is revenue composed across regions? (donut)
- Which customer segment contributes most revenue? (donut)
- How do quarters compare on revenue, cost and profit? (grouped bar)

Trends

Time behaviour at every grain the 44-month range supports, with its own tab rather than buried in the overview.

- How have revenue, profit and cost trended month by month? (line, draggable zoom)
- What has the book accumulated to date? (cumulative area)
- Is order volume growing alongside average order value? (dual-axis line + bar)
- How do quarters compare on revenue, cost and profit? (grouped bar)
- How does each year compare on revenue? (bar)
- Which quarter of the year is strongest? (bar)
- How has profit margin moved by quarter? (line)
- How many units ship each year? (bar)
- How does yearly revenue split between profit and cost? (stacked bar)

Geography

Where the revenue comes from, across both region and state.

- Which states rank highest by revenue? (ranked bar, full width)
- Which state × category combinations concentrate revenue? (heatmap)
- Which regions generate the most revenue? (bar)
- What share of the book does each region hold? (donut)

- Which region converts revenue into profit best? (bar, margin)
- How has each region's revenue built up year over year? (stacked bar)
- How many orders come from each region? (bar)
- How does each region split across customer segments? (stacked bar)

Products

What is being sold — product and category performance, pricing and order size.

- Which products rank highest by revenue? (ranked bar, full width)
- Which products move the most units? (ranked bar, full width)
- How has the category mix of revenue shifted by quarter? (stacked bar)
- Do higher unit prices come with thinner profit margins? (scatter)
- How are order sizes distributed? (histogram)
- Which categories drive revenue? (bar)
- What share of revenue does each category hold? (donut)
- How many units does each category ship? (bar)

Customers

Entity-level analysis — who buys, how often, how big, and how concentrated the book is.

- Which customers generate the most revenue — all 18 accounts? (ranked bar, full width)
- Which accounts order often, and which order big? (scatter)
- How has the segment mix of revenue evolved year over year? (stacked bar)
- Which segment brings the most revenue? (bar)
- What share of revenue does each segment hold? (donut)
- How large is a typical order in each segment? (bar, average order value)
- Which segment converts revenue into profit best? (bar, margin)
- How concentrated is the book in its largest accounts? (cumulative concentration)

Operations

Fulfilment health — what is completed, what is still in flight, and what was lost.

- What is the status composition of the book? (donut)
- How much revenue sits behind each status? (bar)
- Are unfinished orders bigger than completed ones? (bar, average order value by status)
- How has order status mix trended by quarter? (stacked bar)
- Does fulfilment quality differ by region? (stacked bar)
- Does fulfilment quality differ by category? (stacked bar)

Records

Row-level access to the underlying data, driven by the same filters as every chart.

- All 500 orders in a sortable table — every column sortable, all nine sidebar filters applied live
- **Add-order modal** — validates every required field, derives revenue (quantity × unit price) and profit (revenue – cost) as you type, and rejects any order whose cost exceeds its revenue

- **Domain constraint rationale** — $\text{cost} \leq \text{revenue}$ is the one constraint the data actually implies, and it holds for all 500 existing rows
- A successful add refreshes the KPI band and every chart on every tab

3. Filter sidebar

Filters occupy a dedicated, always-visible left column beside the KPI and chart content — never a popover and never folded into the header. The column carries its own internal scroll, so the nine stacked filter groups never push charts down or off-screen.

- **Controls** — visible checkbox lists for all nine dimensions, each option showing its live matching row count
- **Search boxes** — added to the three long lists (states, products, customers) where option counts pass ~8
- **Match indicator** — a running “N of 500 orders match” count sits at the top of the column
- **Reset** — one control clears every active filter
- **Scope** — one filter state drives the KPI band, all 51 charts and the Records table simultaneously

Header row

The top row holds only the page title, the seven-tab switcher, the “Data as of Aug 17, 2026” stamp and the fullscreen toggle. No filters live there. Both normal and fullscreen views scroll rather than compressing charts to fit above the fold.

4. Visual theme

Dark neon: deep near-black surfaces with glowing borders and accents, and cyan as the single base accent.

Why cyan

This is a B2B technology order book — laptops, monitors, cloud software, docking stations. Cyan reads as instrumentation and telemetry rather than retail warmth, which suits an operational sales console. Reserving cyan for revenue also frees the rest of the palette to carry fixed semantic meanings instead of being spent on decoration.

Colour meanings — six colours, one meaning each, identical on every tab

Colour	Fixed meaning
Cyan	Revenue — the base accent, and the primary series in every chart that plots revenue
Green	Profit
Orange	Cost
Pink	Risk and margin
Violet	Volume — order counts and units
Slate	Neutral / inactive states, gridlines and secondary text

No colour is reassigned per chart for variety, so a reader who learns the legend once reads all seven tabs the same way.

5. Verification and QA

The dashboard was only reported finished after all of the following passed.

Automated checks

Check	Result
Lint / type check	Passed — no errors
Test suite	Passed — 34 tests
Production build	Passed
Publish smoke test	Passed — live page renders 200

Data checks against the live server

- The order-book endpoint returns all 500 rows, with revenue \$1,594,785 and profit \$861,256 — matching the source workbook exactly.
- The reported “data as of” value resolves to 17 Aug 2026, the true maximum order date.
- All nine filter lists return the correct option counts: year 4, quarter 4, region 4, segment 3, category 4, status 4, state 10, product 12, customer 18.

Live browser smoke check (1680 × 1050 desktop window)

- **Tab bar** — all seven tabs fit with no overflow, so Records is fully reachable at realistic desktop widths.
- **Filtering** — selecting the West region cut the set to 185 orders, exactly matching that option's sidebar count; charts and the table re-rendered against the filtered set.
- **Chart rendering** — all six Dashboard canvases and all nine Trends canvases render at their intended footprints — dense charts at 1338px wide × 300–360px tall, simple charts sharing rows at 405–638px. No dense chart reads cramped and no simple chart is stretched with dead space.

Fullscreen portal check

The known failure mode — portaled dropdowns and modals rendering outside a fullscreened inner container — was specifically tested and does not occur:

- Fullscreen resolves to the document root element, not an inner dashboard container (verified: the fullscreen element is HTML).
- With fullscreen active, the Add-order modal opens and is contained inside the fullscreen element; its 17 form inputs hit-test as the topmost element at their own coordinates.
- The Region dropdown inside that modal opens in fullscreen and all four options hit-test as clickable rather than being covered by an overlay.
- Typing into the modal's customer field registered normally while fullscreen was active.
- A sidebar filter clicked during fullscreen still re-filtered correctly (500 → 194 orders), confirming the sidebar stays live and interactive in fullscreen.

6. Access

Live page: <https://surething.io/p/4e588667-a234-4dc2-ba89-4957ae767f68?page=ywGURohkGipDffMTnrgCy>

The page is private to the workspace owner and opens from the Pages tab at the top of the Sales Operation project, where it appears as the “Sales Orders Analytics” chip. All 500 orders are persisted in the project database; the dashboard reads from there and never re-parses the source spreadsheet at runtime.
